Arming Switch

This screw type arming switch mounts in a 3/8" hole. See cut-away view below. The support block is reversible for either airframe mounting, or flat surface mounting. When you are satisfied with the fit and placement, epoxy the support block to the switch to hold it in place.

Attach the wires to your altimeter switch wiring terminals. Turning the screw all the way in closes the circuit, turning the screw out opens the circuit. Always make sure that the screw is tightened fully after your rocket is loaded on the pad, and loosened after the flight
